

# THE MINERAL INDUSTRY OF THE PHILIPPINES

By Travis Q. Lyday

The Republic of the Philippines, which is a developing democratic republic, is located just north of the equator about 1,100 kilometers (km) east of the coast of the mainland of Southeast Asia. The country is an archipelago that comprises 7,000 islands, of which fewer than 900 are inhabited by the country's 85 million people; the major islands are Luzon in the north, Visayas in the middle, and Mindanao in the south. The archipelago is within the Pacific "Rim of Fire," which is so-called because of the intense volcanic activity at the margins of the tectonic plates and is well-known for epithermal gold, porphyry copper-gold, and volcanic-hosted massive sulfide deposits.

In 2003, the Philippines was a significant producer of chromite, copper, gold, and nickel and had in the recent past ranked among the world's top 10 producers. Other important mineral commodities were coal, gypsum, silver, and sulfur. Significant deposits of clay, limestone, marble, phosphate, and silica also occur.

More information on the mineral industry of the Philippines can be found in the U.S. Geological Survey Minerals Yearbook 2002, volume III, Area reports—International—Asia and the Pacific.
